

KoApiDoc

for Confluence

API documentation on your pages

Renders OpenAPI and Swagger specifications from page attachments or pasted text.

by HunKonTech

Bookshop API 1.0.0

Books, orders and customers

GET /books

POST /orders

PUT /books/{bookId}

DELETE /orders/{orderId}

Your API reference, right on the Confluence page

KoApiDoc renders Swagger 2.0, OpenAPI 3.0 and OpenAPI 3.1 specifications as a read-only, searchable API reference on Confluence Cloud pages. Paste the specification into the macro, or attach the JSON or YAML file to the page. This document explains what the app does, how it is used, and what it deliberately does not do.

At a glance

What	A Confluence Cloud macro (built on Atlassian Forge) that shows an API specification as a browsable reference.
Supports	Swagger 2.0, OpenAPI 3.0.x, OpenAPI 3.1.x; JSON and YAML; attachments up to 2 MB.
Sources	Text pasted into the macro, or a .json / .yaml / .yml attachment of the same page (always the latest version).
Safety	Runs on Atlassian. No external network access, no own server, no data collected. Reads attachments with the permissions of the viewer.
Looks	Follows the Confluence light and dark theme.
Price	Free to use, also commercially. Source-available; modification and redistribution need the owner's permission.

The problem it solves

Teams keep their API specification in a repository, but the people who need to read it (support, product, partners, new developers) work in Confluence. Copying the spec into a page by hand goes stale; linking to an external viewer means leaving the page and often another tool. KoApiDoc puts a live, readable reference where the team already reads documentation.

Bookshop API 2.1.0 OAS 3.1

Catalogue, orders and customer accounts of an example bookshop (several tags, shared components, OpenAPI 3.1 features).

Accounts

^

The macro on a page: operations grouped by tag, with methods, paths and summaries.

Always the latest version

Point the macro at a .json or .yaml attachment of the page. Upload a new version of the file and the page shows it the next time it is opened - no editing of the page needed. If you prefer, paste the specification straight into the macro instead.

Source

☐ Pasted text ☒ Page attachment

Attachment

multi-tag-3.1.json (4.4 KB)

▼

The macro always shows the latest version of the file. 1 other attachment(s) are hidden (not .json, .yaml or .yml).

Configuration: choose the source and the display options.

Built for large APIs

Readers can search by path, method, summary, operation ID or tag. Editors can show only the tags readers need, choose how much is expanded on load, hide the schemas section or the search box, and pick an automatic or fixed height for long specifications.

For editors and readers

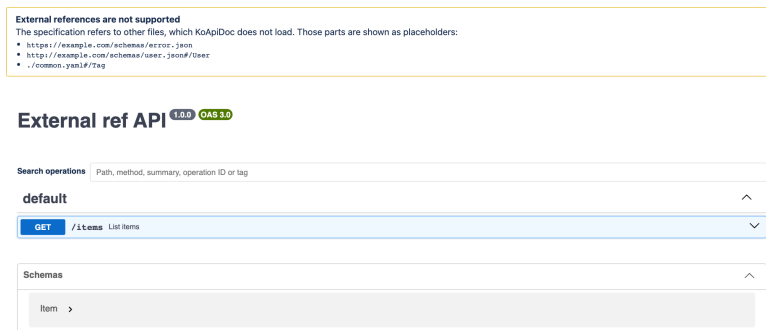

Live preview while configuring (dark theme shown).

The macro follows the Confluence dark theme.

Clear messages instead of silent failures

A broken spec, a missing attachment or a file the viewer may not open each produce a short, readable message. References to external files are listed rather than failing silently.

External \$ref targets are listed above the documentation.

How to use it

1. Edit the Confluence page and type `/`, then choose **KoApiDoc**.
2. Choose the source: paste the specification, or pick an attached .json / .yaml file.
3. Set the display options and check the live preview.
4. Save and publish. Readers see the reference; upload a new file version to update it.

Security and privacy

- Runs entirely on Atlassian's Forge platform; the app declares no external network access.
- Reads only attachments of the page that contains the macro, and only reads - it never creates or changes content.
- Uses the permissions of the person viewing the page; no access means an error message, never the content.
- The specification is processed in the reader's browser. Nothing is stored outside Confluence and nothing is sent to the developer or third parties.
- A pasted specification is stored in the page, so it is visible to those who can edit the page and kept in the page history.

Deliberate limitations

- No "Try it out": requests to your API are not sent from the page.
- References to external files or URLs are not loaded (bundle the spec into one file first).
- Remote images in descriptions are blocked; embedded data: images work.
- Confluence PDF/Word export and printing do not run app macros, so the documentation is missing there.
- Attachments of the same page only; one specification per macro.

Quality

The app is written in TypeScript and tested with unit tests and end-to-end tests including automated accessibility checks. Source code, user guide and privacy policy are public.
